

Basic Use Cases and Execution Plan

As a basic to-do list, the user can put

1. The name of the activity
2. The date of the activity
3. The place of the activity
4. The category of the activity(the tagging system)

on it. It should be ordered by the date, and can use the tagging system to choose the type of activities the user want.

The name and date cannot be empty, so need to limit the input choice. The date also need to be limited into numbers(e.g. yyyyymmdd). Everything can be edit(using the table created by rails it can be easily done).
